Dear Hiring Team,

I am applying for the [ROLE] position at [COMPANY]. I noticed your stack relies on [STACK], which maps directly onto how I have been building and shipping software. Rather than restate my CV, let me connect my experience to what the role needs:

- **Frontend at depth:** React, TypeScript, Next.js and Redux in production, with attention to performance, accessibility, and a tested component architecture.
- **End-to-end delivery:** On my AI medical diagnosis project I owned the React frontend, a Flask REST API, and a hybrid PostgreSQL/MongoDB database – then wired it all into a Jenkins CI/CD pipeline with SonarQube quality gates.
- **Measurable impact:** At Ironbyte I designed scheduling algorithms that cut planning effort and improved efficiency by **40%**.
- **Production backend:** At Ooredoo I built secure Spring Boot services (DAO/DTO layering, REST, access control) with an Angular + PrimeNG frontend and full unit/integration test coverage.
- **Observability & DevOps:** Docker, Jenkins, CI/CD, Prometheus and Grafana – I instrument what I ship so I can see how it behaves in production.

Beyond work, I build and ship my own products (Veinpal, a Next.js platform; OverlayOS, a .NET desktop app) which keeps me sharp on architecture and trade-offs. My code is on [GitHub](#) if you would like to read it.

I would welcome a technical conversation about how I can contribute to [COMPANY]. Thank you for your time and consideration.

Best regards,

Yosr Ben Nagra
